Case study: number

The Development of Syntagmatic Redundancy in ME

Raquel Montero

September 2023

Contents

1 Introduction

This file shows the code used to analyse the data in Section 3 of the paper "Sociolinguistic typology meets historical corpus linguistics"; submitted to the Transactions of the Philological Society. Information on how the data was searched, annotated etc. can be found in the Github repository. The following is a guide to the documents that the repository contains:

- Annotation Guidelines: AnnotationGuidelinesSyntRedME.pdf
- CorpusSearch: CorpusSearchSyntRedME_Adjectives.c//CorpusSearchSyntRedME_Quantifiers.c
- Geographical Information about the texts: GeographicsSyntRedME.pdf
- Final data: SyntRedME_Adjectives.cod.ooo//SyntRedME_Quantifiers.cod.ooo

2 Data Cleaning

First, we need to load the packages that will be used:

```
library(gdata, warn.conflicts = FALSE)  # for drop-levels
library(plyr, warn.conflicts = FALSE)
library(dplyr, warn.conflicts = FALSE)
library(ggplot2, warn.conflicts = FALSE)
library(ggrepel, warn.conflicts = FALSE)
library(splines, warn.conflicts = FALSE)
library(MASS, warn.conflicts = FALSE)
library(reshape2, warn.conflicts = FALSE)
library(maps, warn.conflicts = FALSE)
library(viridisLite, warn.conflicts = FALSE)
library(viridis, warn.conflicts = FALSE)  # colors of the map
library(DHARMa, warn.conflicts = FALSE)  # for residuals
library(colorspace)
suppressPackageStartupMessages(library(sjPlot))  # to change the font
```

Then, we import the annotated data, and prepare it for visualization (e.g. eliminating variables that are not needed, converting to numeric the scores, etc.):

```
## ADJECTIVES DATA:

# Importing the data:

data_agreementadj <- read.delim("Data/SyntRedME_Adjectives.cod.ooo.ooo", header=F, sep=":")

# Naming the columns:
colnames(data_agreementadj) <- c("position",
                                 "agreement",
                                 "Text",
                                 "Year",
                                 "Dialect",
                                 "numsyll",
                                 "animate")

# Eliminate variables not used:
ex.dataadj <- subset(data_agreementadj,
```

```
                      position != "z" &
                        position != "multiple"&  # Eliminating cases with multiple adjectives
                        position != "Conjoined" &  # Eliminating cases of conjoined adjectives
                        agreement!= "z"  &
                        agreement!= "french-agree" &  # Eliminating cases with French  morphology
                        agreement != "adverbial-ly" & # Eliminating adjectives formed with -ly
                        agreement != "e-ending" &     # Eliminate adjectives with root ends in -e
                        agreement != "uninflected" & # Eliminate adjectives uninflected in OE
                        Text != "z"  &
                        Year != "z" &
                        Dialect != "z"  &
                        numsyll == "monosyllabic"  # Only monosyllabic adjectives
                      )

## QUANTIFIERS DATA:

# Importing the data:
data_agreementquant <- read.delim("Data/SyntRedME_Quantifiers.cod.ooo.ooo", header=F, sep=":")

# Naming the columns:
colnames(data_agreementquant) <- c("quant",
                                   "agreement",
                                   "Text",
                                   "Year",
                                   "Dialect",
                                   "numsyll")

# Eliminate variables not used:
ex.dataquant <- subset(data_agreementquant,
                         quant != "z" &
                         agreement != "z" &
                         Text != "z" &
                         Year != "z"  &
                         Dialect != "z"  &
                         numsyll == "monosyllabic"
                       )
```

```
# droplevels: to drop unused factor levels.
ex.dataadj <- droplevels(ex.dataadj)
ex.dataquant <- droplevels(ex.dataquant)

# years stored as numbers:
ex.dataadj$Year <- as.numeric(as.character(ex.dataadj$Year))
ex.dataquant$Year <- as.numeric(as.character(ex.dataquant$Year))

# create a new column changing the agreement type into a binary variable: (agreement = 1, no agreement = 0)
ex.dataadj$agreement_new <- ifelse(ex.dataadj$agreement == "agreement", 1, 0)
ex.dataadj$agreement_new <- as.numeric(as.character(ex.dataadj$agreement_new)) # change into numberic value
ex.dataquant$agreement_new <- ifelse(ex.dataquant$agreement == "agreement", 1, 0)
ex.dataquant$agreement_new <- as.numeric(as.character(ex.dataquant$agreement_new)) #change into numeric value
```

We then have a look at how much data there is for our data analysis:

```
table <- table(ex.dataadj$Dialect)
table
```

```
##
##       EM Northern Southern       WM
##      528       78      276      300
```

```
table1 <- table(ex.dataquant$Dialect)
table1
```

```
##
##       EM Northern Southern       WM
##     1535      272      599      778
```

Calculate the mean agreement per text

```
plot.data2 <- ddply(ex.dataadj, .(Text, Dialect, Year), summarize, whet = mean(as.numeric(as.character(agreement_new)),
    na.rm = T), n = sum(!is.na(as.numeric(as.character(agreement_new)))))
plot.data2
```

```
##                Text  Dialect Year       whet   n
## 1            Aelred       EM 1325 0.77777778  18

## 5  Ayenbyte Southern 1340 0.9467456 169
## 6    Benrul Northern 1425 0.7222222  54
```

Merging the two data sets:

```
## First, merge the two data frames:
total <- merge(plot.data2, plot.data4, by = c("Text", "Dialect", "Year"))

colnames(total) <- c("Text", "Dialect", "Year", "adjectives", "nad", "quantifier",
    "nq")

## New column with the differences in the agreement proportion:
total$diff <- total$adjectives - total$quantifier
```

3 Data Visualization

3.1 Map

First we need to add a column with the coordinates for each text:

```
# Adding column based on new Coordinates:

#Adding the Latitude:

total4 <- total %>%
  mutate(Longitude = case_when(
    (Text== "medicinis") ~ "-0.56880000",
    (Text== "Norwich") ~ "-0.20312085",
```

```
    (Text== "Horses" ) ~ "-1.0318673",
    (Text=="Richard-rolle") ~ "-2.0014878",
    (Text=="Innocencium") ~ "-1.4743217",
    (Text=="Edthor") ~ "-2.2412109",
    (Text=="Mandeville") ~ "0.33441843",
    (Text=="Edmund-m4") ~ "0.0000000",
    (Text=="Gaytry") ~ "-2.2412109",
    (Text=="Capgrave-chrnicle") ~ "1.0000000",
    (Text=="Capgrave-sermon") ~ "0.41325972",
    (Text=="Morte-a") ~ "-1.5536906",
    (Text=="Brut") ~ "-2.9340404",
    (Text=="Kentish-homilies") ~ "-1.8031714",
    (Text=="Royal") ~ "-0.80603102",
    (Text=="Polychronicon") ~ "-2.4498470",
    (Text=="Benrul") ~ "-1.0836749",
    (Text=="Chronicles") ~ "-0.24573507",
    (Text=="Gregory") ~ "-0.60829082",
    (Text=="Cloud") ~ "-1.3818890",
    (Text=="Mirk") ~ "-1.8076144",
    (Text=="Lambeth") ~ "-2.4116106",
    (Text=="Ancrene") ~ "-2.7064436",
    (Text=="Siege-j") ~ "-1.6660928",
    (Text=="Ayenbyte") ~ "1.0814800",
    (Text=="Edmund") ~ "-2.1569555",
    (Text=="Katherine-group") ~ "-2.7064436",
    (Text=="Boethious") ~ "-0.12772404",
    (Text=="Old-testament") ~ "-0.89464405",
    (Text=="Vices") ~ "0.12773182",
    (Text=="Equatorie") ~ "-0.67179476",
    (Text=="Hilton") ~ "-0.22077060",
    (Text=="Kentish-sermons") ~ "0.62063882",
    (Text=="Parson") ~ "-0.12772404",
    (Text=="Trinity") ~ "-1.6118882",
    (Text=="Melibee") ~ "-0.12772404",
    (Text=="Book-vices") ~ "0.11872816",
    (Text=="Astrolabe") ~ "-1.0318673",
    (Text=="wycliffite") ~ "-1.3150252",
    (Text=="Purvey") ~ "-0.12942373",
```

```
    (Text=="Reynard") ~ "0.0000000",
    (Text=="Aelred") ~ "-2.3237144",
    (Text=="Aelred-m4") ~ "0.0000000",
    (Text=="Reynes") ~ "1.5482236",
    (Text=="Psalter") ~ "0.0039963911",
    (Text=="New-testament") ~ "-0.27629328",
    (Text=="Kempe") ~ "1.0000000",

    ))

#Adding the Longitude:

total5 <- total4 %>%
  mutate(Latitude = case_when(
    (Text== "medicinis") ~ "53.065628",
    (Text== "Horses" ) ~ "51.453486",
    (Text== "Norwich") ~ "-53.182303",
    (Text=="Richard-rolle") ~ "53.955093",
    (Text=="Innocencium") ~ "51.068150",
    (Text=="Edthor") ~ "54.690768",
    (Text=="Mandeville") ~ "52.376964",
    (Text=="Edmund-m4") ~ "52.505077",
